

GMM estimator distribution in failure cells (bimodal: clean core near 0 + divergent tails)

$p_{l1}=0.2, p_{l2}=0.2, ph1=0.2, ph2=0.2$
fail rate 8% (shaded = $|est| \leq 10$ core)

$p_{l1}=1.0, p_{l2}=0.2, ph1=0.2, ph2=0.2$
fail rate 7% (shaded = $|est| \leq 10$ core)
